Addendum #2

RFP 20-018

Cow Bayou Watershed Flood Control Structure #8

- Area to be cleared around the plunge pool between 30 and 50 feet
- All trees and vegetation to be removed regardless of diameter
- Trees to be cut down and stumps removed or ground down and sprayed with stump killer chemical
- There is a fence line along part of the backside of the dam that the other side of the fence is owned by different entity, we need to stay on side of the fence of the listed property owner. Clear as best you can.
- There are a number of fence posts on the property. Leave the fence posts, but understand if there was no fence, we do not propose installing one.
- Remove the catwalk; Do not open the valve or make repairs.
- As-built drawings are available for this dam

Note: Note the drawings of the principal spillway profile, there is no cat walk that passes from the dam to the inlet structure. This site has a wooden anti-vortex baffle from the inlet head wall to the embankment, but is not intended to be a cat walk, as it is just 2x6 lumber standing up on its side attached to posts to make the baffle.
